

# WILLCOX WHARF TO WINDMILL POINT REBUILD

## New Structure Locations

At Dominion Energy, safety is our top priority. Due to the special construction requirements associated with this project, we are planning to shift the locations of the anchor structures to provide additional safety clearances for our construction crews.

### Northern Anchor Structure

- We originally planned to relocate the northern anchor structure approximately 110 feet from the existing structure.
- We are now planning to move the northern anchor structure an additional 25 feet north. The structure will be a total of 135 feet from the existing structure.
- This shift will increase safety clearances with the distribution pole on the west side of the right of way.

### Southern Anchor Structure

- We originally planned to relocate the southern anchor structure approximately 50 feet from the existing structure.
- We are now planning to move the southern anchor structure an additional 42 feet south. The structure will be a total of 92 feet from the existing structure.
- This shift will increase crane clearances so workers can safely remove the existing structure and install the new structure.
