Local Power Line Project Information

Staunton-Harrisonburg 115 kV Electric Transmission Project

AT DOMINION ENERGY, we are committed to continually reviewing and analyzing our energy infrastructure to provide safe, reliable electricity to our neighbors. You are receiving this postcard because we are planning to rebuild the existing 115 kilovolt (kV) electric transmission line between our Staunton and Harrisonburg substations traveling through the city of Staunton and Augusta and Rockingham counties.

After more than six decades of operation, the wooden H-frame structures and related components are at the end of their service life and need to be replaced. We are currently in the planning stages of this project and are evaluating options for rebuilding this 22.8-mile line to current 115 kV standards in the existing right of way using brown, weathering steel H-frames. The new structures will be comparable in height to the existing wooden structures.

You may see field crews in or near the right of way corridor collecting information and completing environmental field surveys as we plan this project in the coming months. Soon, we will begin working with the localities on fulfilling permitting requirements. We plan to hold one or more informational open houses before construction on this project begins. You will receive invitations to the open houses in the near future.

Thank you for your patience and understanding as we work to maintain reliable electric service for more than 7,500 Dominion Energy and Shenandoah Valley Electric Cooperative customers.
